- ☐ Change of self-inductance
- ☐ Change of mutual inductance
- ☐ Production of eddy current

- ❑ Differential output configuration
- ❑ Advantages
  - ❑ Sensitivity and accuracy are increased
  - ❑ Output is less affected by the external magnetic field
  - ❑ Variation due to temperature changes is reduced
  - ❑ Effect of change in supply voltage is reduced

- ❑ Working principle
- ❑ Air-cored coils
- ❑ Iron core coils
  - ❑ Advantages: small size and less sensitive to external magnetic field

- ❑ Working principle
- ❑ Application

## Numerical example 1:

In a variable reluctance type proximity inductive transducer shown in the Figure the coil has an inductance of 2 mH when the target made of ferromagnetic material is 1 mm away from the core. Calculate the value of inductance when a displacement of 0.02 mm is applied to the target in a direction moving it towards the core. Show that the change in inductance is linearly proportional to the displacement. Neglect the reluctance of the iron parts.

**Ans:** Change in inductance = 40  $\mu$ H

## Why iron core inductors are not used for high-frequency applications?

- Eddy current loss
- Hysteresis loss
- Saturation of core
- Poor permeability

- ❑ Core: nickel and iron alloy
- ❑ Working principle
- ❑ Input frequency = 50 Hz to 20 kHz
- ❑ Connected in series opposition
- ❑ Phase difference
- ❑ Residual voltage

# Advantages of using LVDT

Thermal sensor

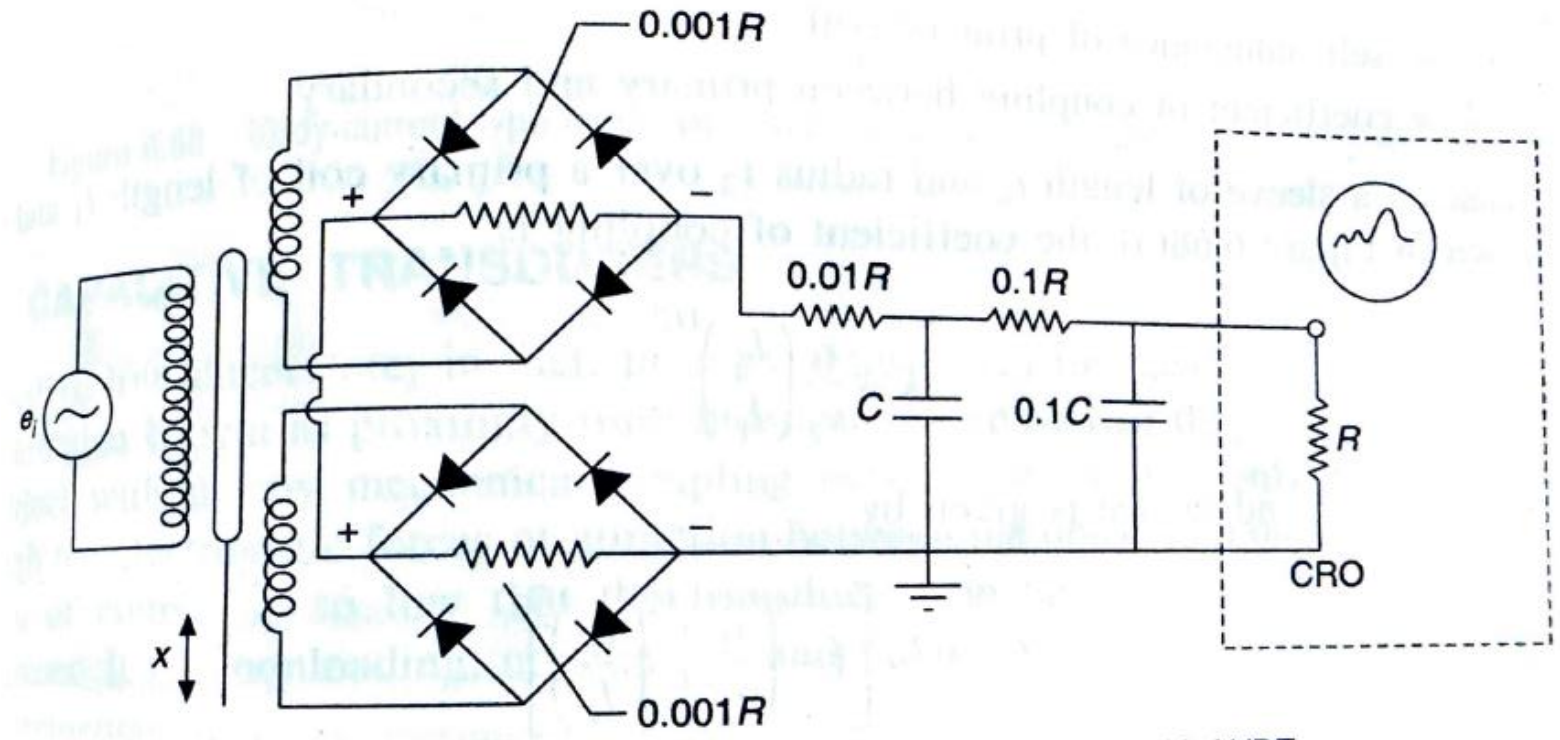

- ☐ Linearity
- ☐ High resolution
- ☐ High output
- ☐ High sensitivity
- ☐ Ruggedness
- ☐ Less friction
- ☐ Low hysteresis
- ☐ Low power consumption

# Disadvantages of using LVDT

Thermal sensor

- ❑ Sensitive to stray magnetic field
- ❑ Sensitive to temperature change
- ❑ Limited to frequency application below 20 kHz

❑ Polarity sensitive demodulator

## □ Working principle

□ Application:

□ Application:

□ Application:

# Capacitive transducer

Thermal sensor

- ❑ Working principle
- ❑ Governing equation

$$C = \epsilon A / d$$
$$C = \epsilon_r \epsilon_0 A / d$$

- ❑ Working principle:
  - Change in overlapping area
  - Change in distance
  - Change the dielectric constant
- ❑ Output impedance
$$X_c = 1/2\pi fC$$
- ❑ Maximum power transfer theorem

## Impedance matching

$$\eta = \frac{P_L}{P_{\text{Total}}} = \frac{I^2 \cdot R_L}{I^2 \cdot (R_L + R_S)} = \frac{R_L}{R_L + R_S} = \frac{1}{1 + R_S/R_L}.$$

## Change in area

## Change in area

## Change in area (angular displacement)

$$C_{\text{multi}} = \frac{\epsilon A}{d} = \frac{\pi \epsilon r^2}{2d}$$

$$C = \frac{\epsilon r^2}{2d} \cdot \theta$$

## Applications: cantilever spring plate

## Applications: rotational displacement

## Differential arrangement

## Variation of dielectric constant

## Liquid level measurement

## Advantages of capacitive transducers

- Small operating force
- Extremely sensitive
- Good frequency response
- Minimum loading effect
- Small operating voltage is required
- Low resolution can be obtained using these transducers

## Disadvantages of capacitive transducers

- Insulation
- Edge effect → Guard ring
- High output impedance
- Connecting cable
- Environmental effect (dust particles and moisture)
- Temperature sensitivity
- Signal conditioning unit

## Applications of capacitive transducers

- Measurement of linear and angular displacement
- Measurement of force and pressure
- Pressure sensor → Change in dielectric constant
- Measurement of humidity

## Numerical example 1:

The figure shows a capacitive transducer using five plates. The dimensions of each plate are  $25 \times 25$  mm and the distance between plates is 0.25 mm. This arrangement is to be used to measure displacement by observing the change in capacitance with the distance  $x$ . Calculate the sensitivity of the device. Assume that the plates are separated by air. The permittivity of air is  $8.85 \times 10^{-12}$  F/m.

**Ans:** 3.54 pF/mm
